

## Introduction

- Angelman Syndrome (AS) is a genetic disorder that occurs in approximately 1 in 15,000 births (Angelman Syndrome Foundation, n.d.).
- The primary cause of AS is the deletion of bands 11-13 on the long arm of the maternally inherited 15<sup>th</sup> chromosome (Clayton-Smith & Laan, 2003), while other cases of AS are caused by specific defects in imprinting of the UBE3A gene, the replacement of the maternal copy of UBE3A by a second paternal copy, or other unknown origins (Clayton-Smith & Laan, 2003; Jolleff et al, 2006).
- AS is characterized by global developmental delays, little or absent speech, motor disorder—such as ataxia, intellectual disability, hyperactivity, and seizures (Jolleff et al, 2006).
- Individuals with AS' expressive language skills are characterized by limited speech, typically with fewer than five words (Weltman & Weiman, 2016).
- Individuals with AS display stronger comprehension of spoken language than their production (Alvares & Downing, 1998; Weltman & Weiman, 2016).
- Given their phenotypical and developmental profiles, individuals with AS can be characterized as having complex communication needs (CCN). They often require the use of augmentative and alternative communication (AAC).
- There is limited research on the use of AAC with individuals with AS to improve communication skills.

## Purpose

- The primary goals of this synthesis are:
  - (a) review and synthesize current research in the field of AAC as it relates to AS;
  - (b) identify strengths and gaps in the current research;
  - (c) determine clinical implications for the use of AAC with individuals with AS.

## Methods

SEARCH	INCLUSION CRITERIA	DATA EXTRACTION AND CODING
<b>Databases:</b> <ul style="list-style-type: none"> <li>• EBSCO (Academic Search Complete), ERIC, PsychInfo, PubMed, Linguistics and Language Behavior Abstracts (LLBA), and Pennsylvania State University library</li> </ul> <b>Search term categories</b> <ul style="list-style-type: none"> <li>• “Angelman syndrome”, “AAC”, “augmentative communicat*”</li> </ul> <b>Author and Ancestry Review</b>	<ul style="list-style-type: none"> <li>• Peer-reviewed scholarly journal</li> <li>• Research participants diagnosed with AS</li> <li>• Study outcomes were related to AAC use</li> <li>• Experimental studies, qualitative reports from caregivers, or review of clinical data</li> </ul>	<ul style="list-style-type: none"> <li>• Study authors and design</li> <li>• Participant age/gender</li> <li>• Context</li> <li>• Type of AAC</li> <li>• Intervention/training</li> <li>• Target measure/DV</li> <li>• Gain score</li> <li>• PND/TauU</li> <li>• Certainty of evidence</li> </ul>

## Results

The systematic search identified 3 quantitative and 9 qualitative studies (11 studies total)

### Quantitative Studies

PARTICIPANTS	TYPES OF AAC
<ul style="list-style-type: none"> <li>• Participants ranged in age from 21 months to 10 years</li> <li>• Three males, two females (n=5).               <ul style="list-style-type: none"> <li>• 40% two years and under (n=2)</li> <li>• 60% nine years and older (n=3).</li> </ul> </li> </ul>	<ul style="list-style-type: none"> <li>• Unaided AAC:               <ul style="list-style-type: none"> <li>• Gestures</li> <li>• enhanced natural gestures</li> <li>• sign</li> </ul> </li> <li>• Aided AAC:               <ul style="list-style-type: none"> <li>• graphic symbols</li> <li>• vocal output device</li> <li>• speech generating devices</li> <li>• PECS, picture boards, and object</li> </ul> </li> </ul>
INTERVENTION CONTEXT	DEPENDENT VARIABLES
<ul style="list-style-type: none"> <li>• 20% in the home (n=1)</li> <li>• 40% in a preschool setting (n=2)</li> <li>• 60% in the school setting (n=3)</li> </ul>	<ul style="list-style-type: none"> <li>• increased requests for preferred items</li> <li>• increased initiations with clear intentions</li> <li>• increased spontaneous use of ENG.</li> </ul>
INTERVENTION CHARACTERISTICS	DEPENDENT VARIABLES
<ul style="list-style-type: none"> <li>• Prompting</li> <li>• Modeling</li> <li>• Aided and unaided AAC</li> <li>• Structured enhanced natural gesture instructional protocol.</li> </ul>	<ul style="list-style-type: none"> <li>• increased requests for preferred items</li> <li>• increased initiations with clear intentions</li> <li>• increased spontaneous use of ENG.</li> </ul>

### Qualitative Studies

PARTICIPANTS	IDENTIFIED THEMES
<ul style="list-style-type: none"> <li>• 654 parent/provider respondents               <ul style="list-style-type: none"> <li>• 3 professionals (.46%)</li> <li>• 651 including parents (99.54)</li> <li>• Individuals with AS that were included ranged from birth to adulthood (age 66), with a total sample of 954.</li> </ul> </li> </ul>	<ul style="list-style-type: none"> <li>• <b>Acceptability and usefulness-</b> perceived acceptability and long-term use</li> <li>• <b>Effectiveness/success-</b> perceived effectiveness, effectiveness when used consistently, changes in previously used gestures, and ease of teaching others</li> <li>• <b>Willingness-</b> willingness to utilize and change daily schedules, as well as reasonableness of the intervention</li> <li>• <b>Priorities-</b> summarizes parent perceptions and priorities of AAC use</li> <li>• <b>Disadvantages-</b> perceived disadvantages, disruptiveness, negative side effects, amount of use, and reason for rejection</li> </ul>
COLLECTION METHODS	IDENTIFIED THEMES
<ul style="list-style-type: none"> <li>• Likert scale questionnaires</li> <li>• Web surveys</li> <li>• Communication Inventories.</li> <li>• Parent and professional reports</li> </ul>	<ul style="list-style-type: none"> <li>• <b>Acceptability and usefulness-</b> perceived acceptability and long-term use</li> <li>• <b>Effectiveness/success-</b> perceived effectiveness, effectiveness when used consistently, changes in previously used gestures, and ease of teaching others</li> <li>• <b>Willingness-</b> willingness to utilize and change daily schedules, as well as reasonableness of the intervention</li> <li>• <b>Priorities-</b> summarizes parent perceptions and priorities of AAC use</li> <li>• <b>Disadvantages-</b> perceived disadvantages, disruptiveness, negative side effects, amount of use, and reason for rejection</li> </ul>

## Discussion and Implications

- Individuals with AS are reported to benefit from AAC supports, evidenced by both the quantitative and qualitative studies.
- The specific AAC interventions and supports that best meet the needs of individuals with AS is still unclear; however, guidance from parent perspectives can be beneficial.
- Acceptance of a device for individuals' with AS was based on increased success in interactions and independence; while parent willingness and perceived usefulness of device was based on the individual with AS' success with a device.
- The use of systems that were non-symbolic for individuals with AS received higher ratings in the themes of usefulness and importance, followed by electronic devices (i.e. aided AAC), and finally enhanced natural gestures (i.e. unaided AAC).
- Across all included studies, all individuals with AS made gains when using AAC—including both aided and unaided AAC; however, outcomes for younger individuals tended to be larger and reported to be more important by caregivers/family members.
- Individuals with AS should be provided with effective, evidence-based AAC supports that are functionally equivalent to their current idiosyncratic means of communicating.
- When providing AAC systems for individuals with AS, access should be quick and reliable; providing meaningful and beneficial outcomes for meeting wants and needs, as well as social closeness.
