1. There are 1,356,314 points in the cloud and the spacing is 1.054. Two classification codes are “ground” with 322,420 points and “noise” with 1,577 points. The unit of measure is feet.

2. Range and elevation are 1193.78 and 1160.6ft. Yes the values make sense because is gives a range of elevation that is possible for the structures.

3. There are hill and valley patterns in the landscape and man made structures. This makes sense.

4. The high and low values are 910.3 and -790.05ft and that is not acceptable for the terrain which does not make sense for the terrain. The most obvious features are the man made structures.

5. No the values are too broad for this terrain but I’m assuming it pulls the numbers from outside this specific area.
