We interact with Artificial Intelligence (AI) everyday, whether we realize it or not. Facebook, YouTube, Netflix, mobile phones, and even email clients utilize AI and machine learning to enhance user experiences. When it comes to education, however, AI is conspicuously absent. Tasks like course design and redesign can be less arduous with the help of AI.

At TLT, we’re hard at work on a suite of tools that leverage aspects of AI to support teaching and learning. We have tools designed to discover and explore topics and concepts, as well as a tool that can assist in the creation of assessments such as quizzes. Several TLT fellows, like Lee Giles and Becky Passonneau, collaborate on this work.

We are hosting a workshop on July 26th, 10:30AM, in the TLT Alley (22 Shields Building), where you can experiment with these tools and explore how they might impact your teaching, as well as conceptualize how the same tools might empower student learning. As our tools are prototypes themselves, we plan to keep things small so we can spend significant time with each participant. If you’d like to participate, please complete this short sign up form.
