Mini Filter Receptacles

Each student will determine the size, form, and details of their receptacle.

The opening in the top of the receptacle should be 5” to 5 ¼” in diameter after firing.

Each receptacle should have a lid. Ideally, the lid should be a cap lid and fit outside the rim of the filter and receptacle opening.

The opening for the spigot should be near the bottom of the receptacle, about 1” above the base, and ¾” in diameter after firing.

Although these receptacles and filters are intended for demonstration and exhibition and not for daily use, the finished receptacles should be at least 8” in height to allow sufficient interior space for filtered water.
